

DRYING SOLUTIONS FOR TRAINING & SERVICE STATIONS

(1) Facilitating the drying process

To facilitate the drying process – especially when suits are very wet inside e.g. after inside washing – we advise to first let the suit drip out in an up-side-down position in order to get rid of any excess water.

(2) Drying the inside of the suits (fitted around the drying hangers)

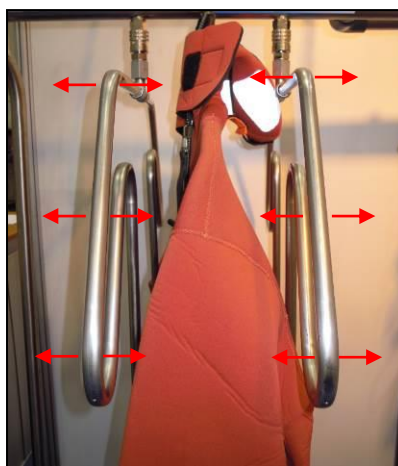

For suits in over-length or for drying after washing (when the fixed boots are completely soaked) it is recommended to slide up the trouser legs on the hanger to allow a forced air stream into the boot tips.

(3) Drying the outside of the suits (fitted between the drying hangers)

suits fitted in-between the drying hangers, so that the airstream points to the outside of the suits

****optional****

wall-mounted blower & mobile drying racks
(optional)
connection is made by a quick coupling

lengthening of mobile rack
possible in case of need

mobile version available in different heights
(for service stations: standard height 185 – 195 cm)
